

Working of JDBC:

- The working of the JDBC can be explained as:-
- 1) First of all Java application establishes connection with data source.
 - 2) Then Java application invokes classes and interface from JDBC driver for sending queries to data source.
 - 3) The JDBC driver connects to corresponding database and retrieves the result.
 - 4) These results are based on SQL statements which are then returned to Java application.
 - 5) Java application then uses the retrieved information for further processing.
